

The Road to a Penny

Sources & Uses — \$ACM deployment for the 99¢ program

August 2026 · scope: this program only · every input read live and stated below

THE 99¢ IS A DONATION TO BRING BACK ALADDIN'S CASTLE — not an investment in \$ACM, not solicited as one, no expectation of profit. The token grant is a membership credential with no cash value inside the system, and the ULA discloses custody, placement and revocation.

01

The target

\$117,292 takes \$ACM from \$0.000227 to \$0.01

And the same buy hands back **77,766,399 tokens** — enough to grant one whole \$ACM to seventy-seven million more members. The capital does not choose between lifting the price and buying inventory. It does both, in one transaction.

A penny is a credible, legible price. At \$0.01 the fully-diluted value is \$9,999,571, but **500,000,000 \$ACM — a full 50.00% of supply — is Streamflow-locked** and assumed to stay locked for twenty-five years or more, so on the float that actually trades the penny price is a **\$5.0 million circulating market capitalisation**. Every member holds **one solid \$ACM**, worth a penny, which is a thing a person can understand.

02

Live inputs

Market	Value	Program	Value
SOL	\$73.00	App price	\$0.99
\$ACM	\$0.00022748	Apple commission	15%
Pool base (pumpswap)	91,578,851 ACM	Grant per member	1 whole ACM
Pool quote	285.38 SOL = \$20,833	Wallet held	11,767,037 ACM
Total liquidity	\$41,639	released as pool	10,000,000
Supply	999,957,146	R&D reserve	1,767,037
		Locked supply	500,000,000
		Free float	499,957,146

03

Unit economics — every download

Line	Amount	Share of 99¢
Price	\$0.9900	100%
Apple commission, 15% Small Business	-\$0.1485	15%
Solana account rent — 0.00204 SOL, non-recoverable	-\$0.1489	15%
Transfer fee	-\$0.0010	0%
\$ACM grant — from inventory already owned	\$0.0000	0%
CONTRIBUTION PER DOWNLOAD	\$0.6916	70%

Rent is the only cost that scales and never comes back. Minting the wallet on first engagement rather than on download is the single largest saving available.

04

What each price target costs

Target price	Capital required	Tokens received	Avg paid	Circ. mkt cap
\$0.0010	\$22,846	47,900,042	\$0.000477	\$0.5M
\$0.0025	\$48,230	63,953,946	\$0.000754	\$1.25M
\$0.0050	\$76,836	72,045,094	\$0.001066	\$2.5M
\$0.0100	\$117,292	77,766,399	\$0.001508	\$5.0M
\$0.0200	\$174,505	81,811,972	\$0.002133	\$10.0M
\$0.0500	\$288,023	85,401,735	\$0.003373	\$25.0M

Priced on the constant-product integral, so slippage is fully included — the average paid at the penny target is \$0.001508, which is 6.6× today's spot. You do not buy 77.8 million tokens at \$0.000227; the price rises as you take them, and that is the point. Market cap is stated on the **499,957,146 free float**, excluding the 500,000,000 locked; fully-diluted values are twice these figures.

05

What the penny buy actually delivers

Outcome	Value	Why it matters
\$ACM price	\$0.01	legible, credible, one penny per member token
Tokens acquired	77,766,399	77.8M more members at one whole \$ACM each
Circulating market cap	\$4,999,571	on the 499,957,146 float; \$10.0M fully diluted
Pool depth after	\$276,250	6.6× deeper — far less fragile to any single trade
Total holding after	89,533,436 ACM	worth \$895,334 at \$0.01
Total inventory runway	87,766,399	downloads, at one solid \$ACM each

The pool goes from \$41,639 to \$276,250 of depth. KRW-C-2026-001 called thin pools "cheap to move, impossible to hold" — this buy is also the fix for that fragility.

06

The app pays for it

At **\$0.6916** of contribution per download, the penny buy is funded by **169,600 downloads**. That is a modest outcome for a nostalgia app, not a moonshot.

Downloads	Cash generated	Against the \$117,292 buy
50,000	\$34,579	\$82,713 short
100,000	\$69,158	\$48,134 short
170,000	\$117,569	FUNDS IT — \$277 to spare
250,000	\$172,895	funds it, \$55,603 over
500,000	\$345,790	funds it, \$228,498 over
1,000,000	\$691,580	funds it, \$574,288 over

07

Sequence

Phase	Action	Capital	Result
1	Launch on the released 10,000,000 pool	\$0	first 10M members funded from tokens already owned
2	At ~170,000 downloads, execute the penny buy	\$117,292	\$ACM reaches \$0.01; 77.8M tokens acquired; pool 6.6x deeper
3	Run on 87.8M tokens of inventory	\$0	no further purchase required for 87.8M members
4	Hold surplus contribution	—	arcade buildout; not further pool buying

Phase 2 timing is a judgement call, not a formula: earlier is cheaper per token but commits capital before the curve is proven, later risks others moving the price first. The \$117,292 assumes the pool as it stands today.

08

The float the penny sits on

Supply	Tokens	Share	At \$0.01	Note
Streamflow-locked	500,000,000	50.00%	\$5,000,000	assumed locked 25+ years
Free float	499,957,146	50.00%	\$4,999,571	the market cap that is real
our holding after the buy	89,533,436	17.9%	\$895,334	program inventory
pool after the buy	13,812,452	2.8%	\$138,125	tradeable depth
all other holders	396,611,258	79.3%	\$3,966,113	the open market
TOTAL SUPPLY	999,957,146	100%	\$9,999,571	fully diluted

The lock does not make the buy cheaper — cost is set by the pool's reserves, not total supply. What it decides is whether the penny **holds**: five hundred million tokens that cannot be sold cannot be sold into our own buying. The model assumes the lock is never released.

09

The ceiling, and it is a real one

Ten million released plus 77.8 million bought is **87.8 million members** at one whole \$ACM each. Beyond that, tokens must come from holders choosing to sell.

Milestone	Members supported	Status
Released pool only	10,000,000	owned outright, no capital
After the penny buy	87,766,399	\$117,292 of capital
Entire pool drained	101,578,851	cost approaches infinity

The 99¢ never fails on economics — at 100 million downloads the token still costs about a cent against 69 cents of contribution. What ends the program is running out of tokens to give, not running out of money to buy them.

Instagram drew 762,300,000 downloads globally in 2025; this program supports 87.8 million of that, and the ceiling would be visible years in advance.

10

What this program needs

\$117,292 · once · funded by the app itself

No capital is required to launch. The first ten million members are funded by \$ACM already owned. The single deployment is the penny buy at roughly 170,000 downloads, and the app generates it. Everything after that is inventory already in hand.
