

ACM Token Lock

Wallet Architecture, Lock Record, and Repeatable Procedure

Aladdin’s Castle Meme Coin (\$ACM) · Solana · Record date: July 24, 2026

Instar Brands · Heretic Capital Partners

MILESTONE: Exactly 500,000,000 ACM — 50.00% of total supply — is now locked on-chain and non-cancelable until July 4, 2027. Both tranches release to a single wallet.

01

Lock Status — 50.00% of Supply

Tranche	Amount (ACM)	% of Supply	Locked From	Unlock
Lock 1 · Jul 5, 2026	402,717,631	40.27%	GNkKQ (after transfer)	Jul 4, 2027
Lock 2 · Jul 24, 2026	97,282,369	9.73%	Fc8T5 (direct)	Jul 4, 2027
TOTAL LOCKED	500,000,000	50.00%	—	Jul 4, 2027 11:59 PM

Both locks are **time-based and non-cancelable** via Streamflow. Tokens cannot be moved, accessed, or unlocked before the unlock date under any circumstances — including by the founder. Both tranches name the same recipient, so the full 500,000,000 returns to one wallet. The locks are publicly verifiable on the Solana blockchain, which is the point: the trust signal only works because it is independently checkable and irreversible.

Wallet Architecture

Two wallets, two jobs. Money enters through the first; trading and token custody happen in the second. Both are controlled by Phantom.

COINBASE+LOCKS — entry point and lock recipient

GNkKQwa4XHdvgF1x4edV3qF54xdz3LykWyD8cgWnVSHQ

SOL from Coinbase lands here. Created Lock 1. Named recipient for BOTH locks — 500,000,000 ACM releases here on Jul 4, 2027.

PUMP CREATE ACM — token creator, trading, custody

Fc8T5MKesqkK24JpQv8VNmk7cNehTN1RuixTtr1RUyho

Created the ACM token (CreateToken tx, Sept 2025). Funded originally by GNkKQ. Holds the ACM balance, receives pump.fun creator rewards, and is the wallet Lock 2 was created from. Same address in both Phantom and pump.fun.

Token identifiers

ACM contract (mint)	4PRz3EwhbjrrX6YksMDuUzrXT51pr7CQtXNCravhpump
PumpSwap pair	HKSDMJ6KThscZXMVvuS24wvK3WGzfuepQhwdKCjHKEpZ
Total supply	1,000,000,000 ACM

Capital flow: Coinbase > GNkKQ (Phantom) > Fc8T5 (pump.fun) > swap SOL for ACM via the AMM pool. Locks are created from wherever the tokens sit; the recipient field decides where they come home.

Lock Procedure — Repeatable

Verified working sequence. Streamflow reads the blockchain directly, so it sees ACM in the pump wallet even when Phantom does not display it. No token transfer is required.

- 1. Fund gas first.** Ensure the locking wallet holds **at least 0.3 SOL** before starting. This is the single most common failure point.
- 2. Calculate the exact amount.** Target percentage $\times$ 1,000,000,000, minus anything already locked. Type the figure — never use “Max.”
- 3. Connect the wallet holding the tokens** to Streamflow via Phantom’s in-app browser. Confirm the token dropdown shows the full balance (watch for the “M” suffix — 98.6546M is millions, not 98 tokens).
- 4. Configure:** Token = ACM · Amount = exact figure · Unlock schedule = time-based, single date · 11:59 PM.
- 5. Set the recipient.** Toggle **“Use connected wallet” OFF**, then paste the destination address. Verify the last six characters. This field is permanent.
- 6. Review:** confirm the “Remaining amount” figure matches expectation, then check lock type, amount, date, recipient, and the 0.5% fee line.
- 7. Sign.** If Phantom shows a red simulation error, **close it** — do not use “Confirm (unsafe).” Fix the cause and retry.

Budget the fee: Streamflow charges a 0.5% token fee ON TOP of the locked amount. Lock 2 cost 486,412 ACM in fees beyond the 97,282,369 locked. Always hold a cushion above the target — never the exact amount.

Key Learnings

Gas is the failure point

A lock does not just pay a network fee — it creates escrow accounts on-chain, each carrying a rent deposit. Observed: **0.10 SOL (~\$7.92) failed simulation; 0.33 SOL (~\$25.55) succeeded**. Keep **0.3 SOL minimum** in the locking wallet. Denominate in SOL, not dollars, since the USD figure moves with the SOL price.

Phantom hides pump.fun tokens — Solscan is the source of truth

Phantom filters unverified pump.fun tokens from its display, so the ACM balance can read as near-zero even when tokens are present. This does not affect custody: Phantom holds the key and can sign for the tokens regardless. Always verify balances on Solscan, never from the wallet UI.

Recipient is NOT the source

The Streamflow “Wallet address” field is the **destination on unlock**, not where tokens come from. It defaults to the connected wallet. Toggling it off and setting a deliberate recipient is what routes every tranche back to a single wallet. It cannot be changed after signing.

Address hygiene

The creator wallet was spam-dusted on day one — dozens of microscopic transfers from bot addresses, a known address-poisoning setup. One such address persists in the pump.fun Recents list and cannot be deleted. **Verify the first and last characters of any recipient before confirming**. Poisoned addresses are built to match on both ends and differ in the middle.

Naming discipline

Wallet labels must describe what the wallet actually does. A mislabeled account cost hours of diagnosis. Current names — COINBASE+LOCKS and PUMP CREATE ACM — are correct and should not be changed without updating this record.

Forward Policy — Future Tokens

Each future token gets its **own dedicated lock-recipient wallet**. Locks are not pooled across projects. This keeps per-project accounting clean, keeps each token’s public lock story independently verifiable, and prevents one project’s wallet history from entangling another’s. Name each wallet for its project and record the address here before the first lock.

The 50.00% figure is exact and verifiable. When describing it publicly, state it precisely: 50% of total supply is locked until July 2027, and additional unlocked tokens are held separately. Precision is the asset — keep the claim as exact as the number.

Security Notes

This document contains **public wallet addresses only**. Public addresses are visible to anyone on the blockchain by design and cannot be used to move funds. This record deliberately contains **no seed phrase, no private key, and no password** — and none should ever be added to it, stored digitally, photographed, or transmitted. Anyone holding the seed phrase controls the wallet outright.

The operative risk to this project is **error, not intrusion**: a wrong recipient address, a mistyped amount, or an irreversible action taken on bad information. Accurate records are the control. Keep this document accessible enough to consult before every lock.

Confidential — internal operating record. Prepared for Instar Brands / Heretic Capital Partners. Figures verified on-chain as of July 24, 2026. Not legal, tax, or investment advice. Public-facing descriptions of the lock should be reviewed by counsel before publication.
